Product description:

ALLAN BRADLEY's GUARD MASTER.

A ROCKWELL wired HM handle designed for industrial use.

A dead man's handle that complies with machine regulations.

With its extremely robust design and ergonomic shape, the main function of the GUARDMASTER wired dead man's handle is the “dead man” function.

Dead man's devices on fixed installations: The dead man's switch system is a safety component designed to stop product transfer in an emergency (for example, if the operator notices a product spill, a fire starting, or if they feel unwell). If the operator does not press the dead man's switch handle at regular intervals, delivery is automatically stopped. Under normal refueling conditions, the dead man's switch allows the flow to start when held in the hand and stops the flow when released.

Specifically developed for machine monitoring operations, this handle can also be used for most applications where a dead man's switch is required.
